

Conversion Tracking Setup Checklist

The plumbing behind every marketing decision — if this is broken, everything built on top of it is guessing.

FOUNDATION

- ☐ Every advertising platform in use (Google, Meta, etc.) has its tag or pixel installed sitewide
- ☐ A tag management system (like Google Tag Manager) is used instead of hand-pasting scripts into every page
- ☐ Tags are verified firing correctly with each platform's own debug tool, not just assumed to work

CROSS-PLATFORM CONSISTENCY

- ☐ The same actions are defined as conversions consistently across GA4, Google Ads, and Meta
- ☐ Server-side tracking (CAPI, sGTM) is considered if iOS privacy changes are undercounting conversions
- ☐ UTM parameters are used consistently on every campaign link so traffic sources are never a guess

WHAT TO TRACK

- ☐ Form submissions fire a distinct, correctly labeled conversion event
- ☐ Phone number clicks are tracked, especially on mobile
- ☐ Purchases or bookings pass real transaction values, not just a completion flag
- ☐ Duplicate conversions are prevented — the same action should not fire the same event twice

MAINTENANCE

- ☐ Tracking is re-tested any time the website, checkout, or booking flow changes
- ☐ A quarterly audit confirms every event is still firing and every value is still accurate
